

Lecture 14

MCMC convergence

and

pymc3 continued

Last time

- the normal-normal model with MCMC
- then with pymc3
- bayesian regression and updating
- regularization and the ridge
- from the normal model to regression using pymc
- posterior vs predictive in regression problems

Today

- a switchpoint model
- more pymc3 practicalities
- data imputation using posterior predictives
- Geweke, Gelman-Rubin, and ESS

- Regression with custom priors
- identifiability and sampling
- regression identifiability and lasso

Model

$$y|\tau, \lambda_1, \lambda_2 \sim \textit{Poisson}(r_t)$$

$$r_t = \lambda_1 \text{ if } t < \tau \text{ else } \lambda_2 \text{ for } t \in [t_l, t_h]$$
$$\tau \sim \textit{DiscreteUniform}(t_l, t_h)$$

$$\lambda_1 \sim \textit{Exp}(a)$$

$$\lambda_2 \sim \textit{Exp}(b)$$

```

from pymc3.math import switch
with pm.Model() as coaldis1:
    early_mean = pm.Exponential('early_mean', 1)
    late_mean = pm.Exponential('late_mean', 1)
    switchpoint = pm.DiscreteUniform('switchpoint', lower=0, upper=n_years)
    rate = switch(switchpoint >= np.arange(n_years), early_mean, late_mean)
    disasters = pm.Poisson('disasters', mu=rate, observed=disasters_data)

```

```

with coaldis1:
    stepper=pm.Metropolis()
    trace = pm.sample(40000, step=stepper)

```

100% |██████████| 40000/40000 [00:12<00:00, 3326.53it/s] | 229/40000 [00:00<00:17, 2289.39it/s]

```

2.189	1.825	0.078	[0.000, 6.000]	
0.950	0.980	0.028	[0.000, 3.000]	
Posterior quantiles:				
2.5	25	50	75	97.5
-----	=====	=====	-----	
0.000	1.000	2.000	3.000	6.000
0.000	0.000	1.000	2.000	3.000

Model convergence

- traces white noisy
- diagnose autocorrelation, check parameter correlations

```
pm.trace_to_dataframe(trace).corr()
```

- visually inspect histogram every m samples
- traceplots from different starting points, different chains
- formal tests: Geweke, Gelman-Rubin, Effective Sample Size

Gewecke: difference of means

$$H_0 : \mu_{\theta_1} - \mu_{\theta_2} = 0 \implies \mu_{\theta_1 - \theta_2} = 0$$

$$\sigma_{\theta_1 - \theta_2} = \sqrt{\frac{\text{var}(\theta_1)}{n_1} + \frac{\text{var}(\theta_2)}{n_2}}$$

$$|\mu_{\theta_1} - \mu_{\theta_2}| < 2\sigma_{\theta_1 - \theta_2}$$

```
with coaldis1:  
    stepper=pm.Metropolis()  
    tr = pm.sample(2000, step=stepper)  
  
z = geweke(tr, intervals=15)  
  
plt.scatter(*z['early_mean'].T)  
plt.hlines([-1,1], 0, 1000, linestyle='dotted')  
plt.xlim(0, 1000)
```

Gelman-Rubin

Multiple chains..compute within chain variance and compare to between chain variance

$$s_j^2 = \frac{1}{n-1} \sum_i (\theta_{ij} - \mu_{\theta_j})^2$$

$$w = \frac{1}{m} \sum_j s_j^2; \mu = \frac{1}{m} \sum_j \mu_{\theta_j}$$

$$B = \frac{n}{m-1} \sum_j (\mu_{\theta_j} - \mu)^2$$

Use weighted average of w and B to estimate variance of the stationary distribution `pm.gelman_rubin(trace)`:

$$\hat{Var}(\theta) = \left(1 - \frac{1}{n}\right)w + \frac{1}{n}B$$

Overestimates our variance, but unbiased under stationarity.

Ratio of the estimated distribution variance to asymptotic one:

$$\hat{R} = \sqrt{\frac{\hat{Var}(\theta)}{w}}$$

ESS: Effective Sample Size

IIDness of draws decreases

```
pm.effective_n(trace)
```

```
{'early_mean': 16857.0,  
 'early_mean_log_': 12004.0,  
 'late_mean': 27344.0,  
 'late_mean_log_': 27195.0,  
 'switchpoint': 195.0}
```

(40000 samples)

$$n_{eff} = \frac{mn}{1 + 2 \sum_{\Delta t} \rho_{\Delta t}}$$

Posterior Predictive Checks

```
with coaldis1:  
    sim = pm.sample_ppc(t2, samples=200)
```

Regression (again)

Data:

Model

$$\alpha \sim \textit{Uniform}(-100, 100)$$

$$\beta \sim (1 + \beta^2)^{-3/2}$$

$$\sigma \sim 1/\sigma$$

$$\mu = \alpha + \beta x$$

$$y \sim N(\mu, \sigma)$$

Priors

For σ : $1/\sigma$ is Jeffrey's prior for $\sigma|\mu$.

For μ use symmetry: $y = \alpha + \beta x$; $x = \alpha' + \beta' y$

Thus $\alpha' = \beta/\alpha$, and $\beta' = 1/\beta$.

Jacobian is $\beta^3 \implies q(\alpha', \beta') = \beta^3 p(\alpha, \beta)$

Thus $p(-\alpha/\beta, 1/\beta) = \beta^3 p(\alpha, \beta)$ gives $\beta \sim (1 + \beta^2)^{-3/2}$

Sampling

```
import theano.tensor as T

with pm.Model() as model1:
    alpha = pm.Uniform('intercept', -100, 100)

    # Create custom densities, you must supply logp
    beta = pm.DensityDist('beta', lambda value: -1.5 * T.log(1 + value**2), testval=0)
    eps = pm.DensityDist('eps', lambda value: -T.log(T.abs_(value)), testval=1)

    # Create likelihood
    like = pm.Normal('y_est', mu=alpha + beta * xdata, sd=eps, observed=ydata)

with model1:
    stepper=pm.Metropolis()
    tracem1 = pm.sample(40000, step=stepper)

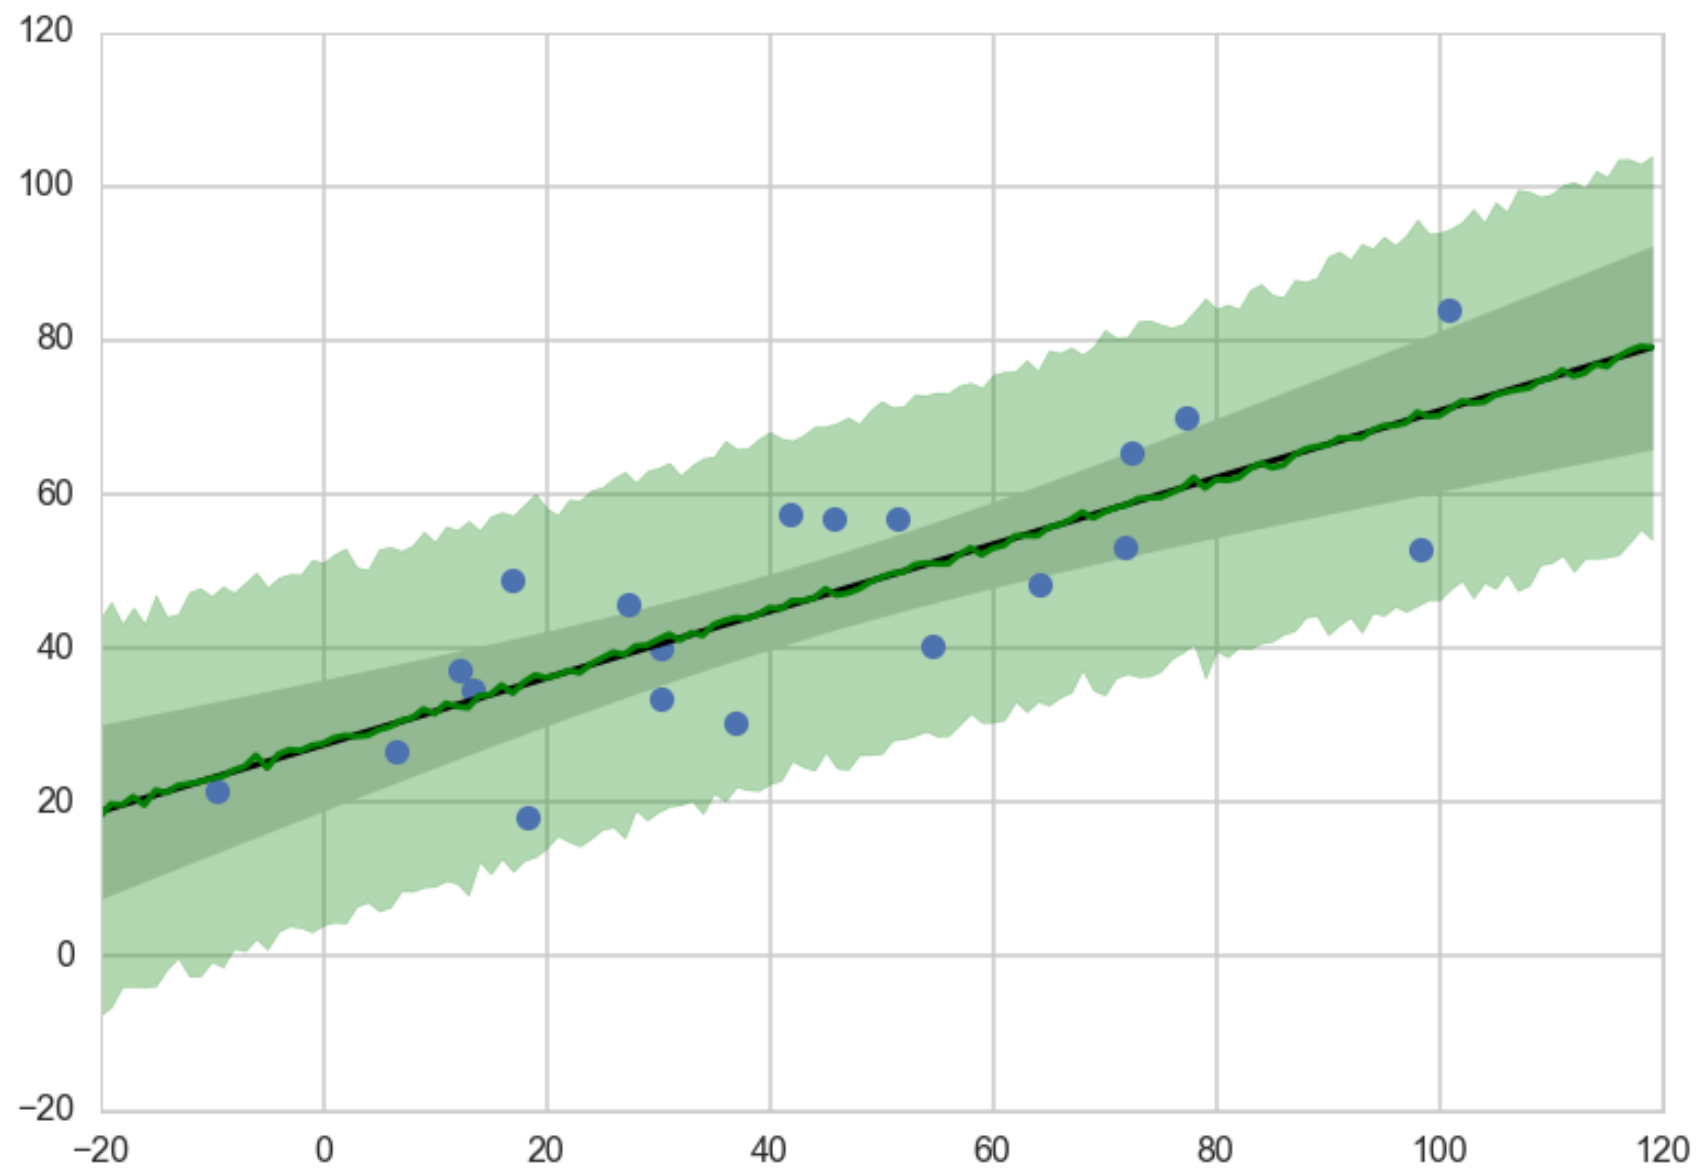

100%|██████████| 40000/40000 [00:10<00:00, 3952.57it/s] | 405/40000 [00:00<00:09, 4044.57it/s]
```

Results

Bug in pymc3 means njobs based tests fail. Run sequentially. Geweckes close to 0.

Sampling with posterior predictive

```
from theano import shared
xdata_shared = shared(xdata) # MAKE into SHARED THEANO VECTOR

import theano.tensor as T

with pm.Model() as model1:
    alpha = pm.Uniform('intercept', -100, 100)

    # Create custom densities, you must supply logp
    beta = pm.DensityDist('beta', lambda value: -1.5 * T.log(1 + value**2), testval=0)
    eps = pm.DensityDist('eps', lambda value: -T.log(T.abs_(value)), testval=1)

    # Create likelihood, SEE xdata_shared BELOW
    like = pm.Normal('y_est', mu=alpha + beta * xdata_shared, sd=eps, observed=ydata)

xdata_oos=np.arange(-20, 120,1) #out of sample
xdata_shared.set_value(xdata_oos)

ppc = pm.sample_ppc(tm1, model=model1, samples=500)

>>>ppc['y_est'].shape, xdata.shape, xdata_oos.shape
((500, 140), (20,), (140,))
```

Non-Identifiability

Generate data from $N(0,1)$. Then fit:

$$y \sim N(\mu, \sigma)$$

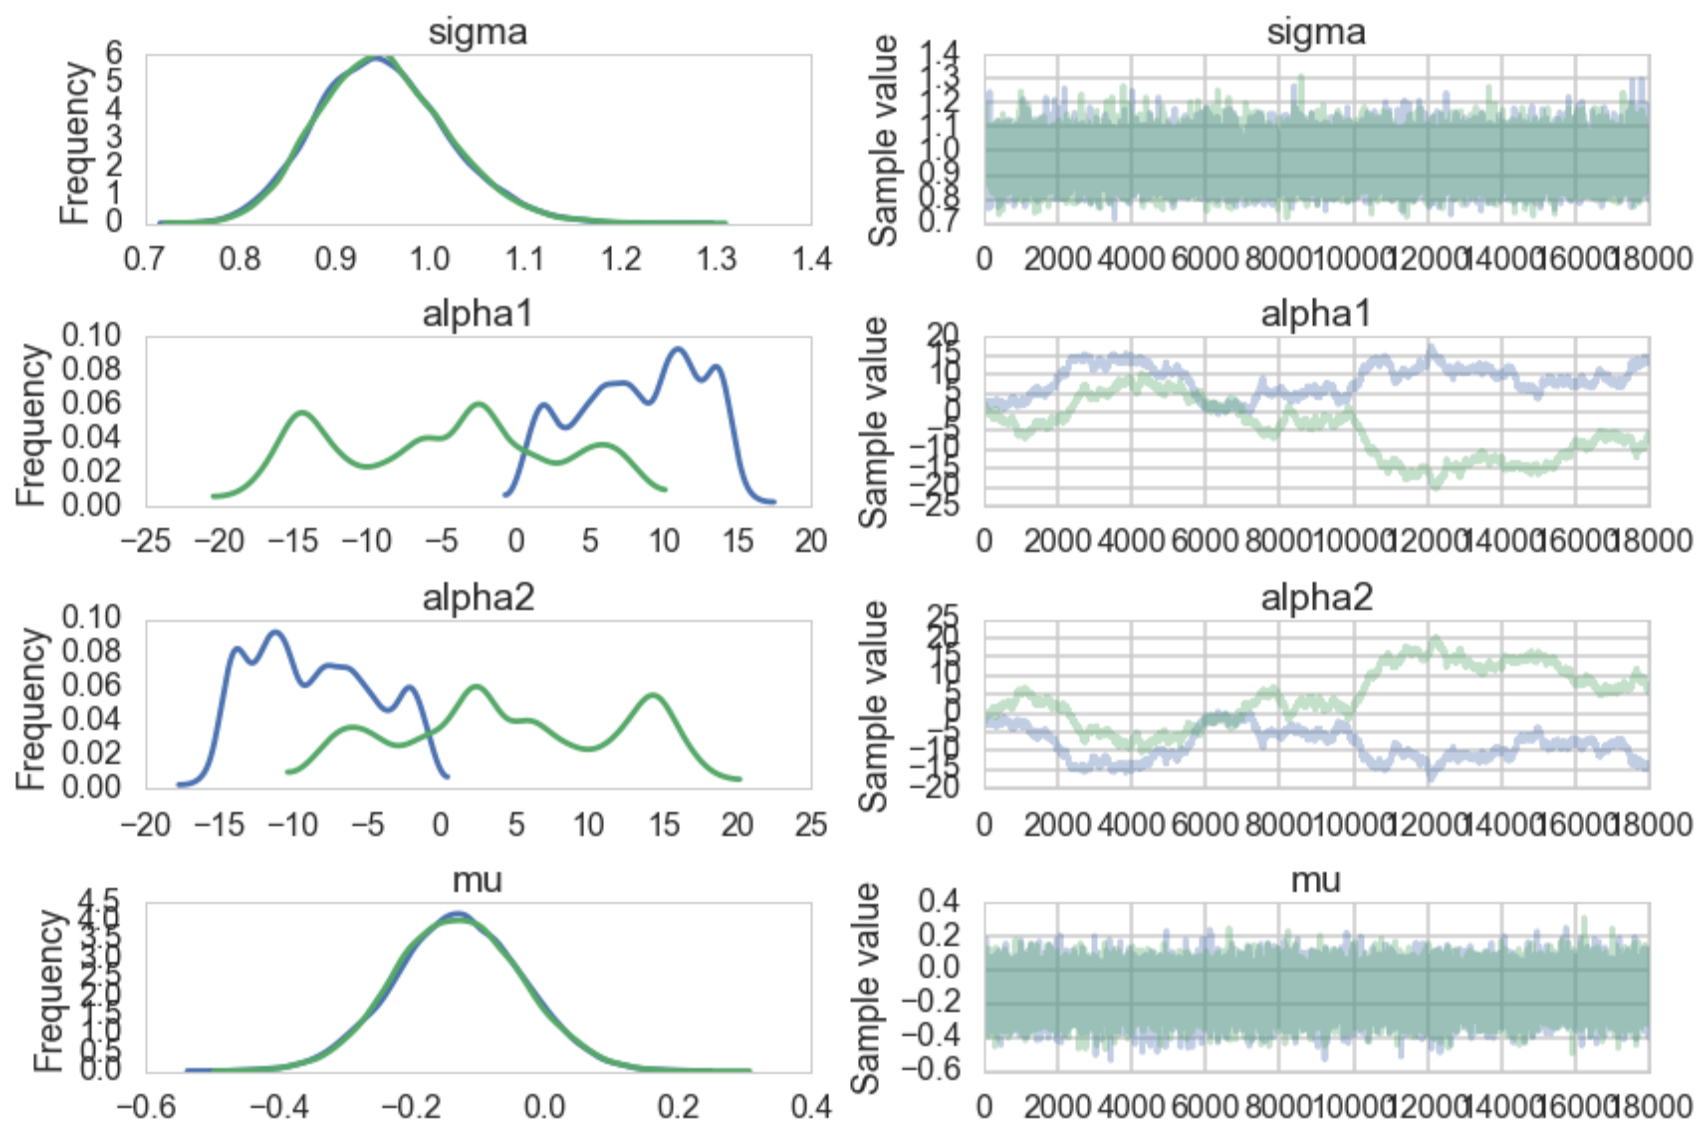

$$\mu = \alpha_1 + \alpha_2$$

$$\alpha_1 \sim \text{Unif}(-\infty, \infty)$$

$$\alpha_2 \sim \text{Unif}(-\infty, \infty)$$

$$\sigma \sim \text{HalfCauchy}(0, 1)$$

Non-Identifiability

```
with pm.Model() as ni:
    sigma = pm.HalfCauchy("sigma", beta=1)
    alpha1=pm.Uniform("alpha1", lower=-10**6, upper=10**6)
    alpha2=pm.Uniform("alpha2", lower=-10**6, upper=10**6)
    mu = pm.Deterministic("mu", alpha1 + alpha2)
    y = pm.Normal("data", mu=mu, sd=sigma, observed=data)
    stepper=pm.Metropolis()
    tracen1 = pm.sample(100000, step=stepper, njobs=2)
```

100%|██████████| 100000/100000 [01:17<00:00, 1286.59it/s] 1/100000 [00:00<3:20:31, 8.31it/s]

```
df=pm.trace_to_dataframe(tracen1)
df.corr()
```

	sigma	mu	alpha1	alpha2
sigma	1.000000	-0.000115	-0.003153	0.003152

```

Attempt to fix

```
with pm.Model() as ni2:
    sigma = pm.HalfCauchy("sigma", beta=1)
    alpha1=pm.Normal("alpha1", mu=5, sd=1)
    alpha2=pm.Normal("alpha2", mu=-5, sd=1)
    mu = pm.Deterministic("mu", alpha1 + alpha2)
    y = pm.Normal("data", mu=mu, sd=sigma, observed=data)
    #stepper=pm.Metropolis()
    #traceni2 = pm.sample(100000, step=stepper, njobs=2)
    traceni2 = pm.sample(100000, njobs=2)
```

Average ELBO = -143.13: 100%|██████████| 200000/200000 [00:18<00:00, 10759.64it/s], 9912.87it/s]
100%|██████████| 100000/100000 [06:30<00:00, 255.83it/s]

NUTS sampler slower but covers better
for this

We construct a model

$$y = 10x_1 + 10x_2 + 0.1x_3$$

where $x_1 \sim N(0, 1)$, $x_2 = -x_1 + N(0, 10^{-3})$ and $x_3 \sim N(0, 1)$

Thus our real model is

$$y = 10N(0, 10^{-3}) + 0.1N(0, 1)$$

```
>>>np.dot(np.dot(np.linalg.inv(np.dot(X.T, X)), X.T), y)
